

## Defect List

The Defect List window displays information about physical defects on the surface of the disk media. DOS prevents data from being written to these defective sectors. Both removable and non-removable disk media can have defect list information. The SCSI Interrogator can read the defect lists of nearly all disk devices.

<b>Primary Defect List (Plist)</b>	A list of "permanent" defects (i.e., defects found during testing by the manufacturer). This information, usually supplied by the disk manufacturer, does not change during the life of the device.
<b>Grown Defect List (Glist)</b>	A list of defects that have occurred on the media since it was manufactured. This includes defects detected by DOS during formatting, defects identified with the ASSIGN BLOCKS command, and defects previously detected by the <u>target</u> and automatically reallocated. The Grown Defect List does not duplicate any information from the Primary Defect List.
